NISHIJIN PACHINKO
BATTERY PACK CONVERSION KIT

CONTENTS

(2) 1.25 Volt miniature screw base bulbs
(1) AGC Fuse Replacement Bar
(1) 9 volt battery cable

Dear Customer:

Thank you for buying a Nishijin Pachinko machine. We hope this battery pack conversion kit will add to your enjoyment of Pachinko. The kit contains everything you need except one 9 volt battery which you may easily obtain from any retailer who carries batteries. We recommend that you purchase a heavy duty battery such as a Duracell.

Your machine was connected to a 10 volt electrical system in Japan. This voltage is not available in the United States. However, you can convert your machine to a standard 9 volt battery operated system by following the simple instructions on the reverse side of this page.
1. Purchase a heavy-duty 9 volt battery.
2. Remove the machine's existing fuse and insert the conversion kit's fuse replacement bar.
3. Pull the jackpot bulb receptacle (R) straight out. Replace the bulb you find there with either one of the kit's two bulbs. Screw the bulb in tight and replace the receptacle.
4. Remove the "Empty" supply tray bulb receptacle by holding the black rubber backing and pulling straight down. Again, replace the bulb, screw it tight, and replace the entire receptacle (S).
5. Unscrew the two colored pins marked (A) and (B). Insert the bare part of either one of the battery cable wires into either of the holes which were exposed when you unscrewed the colored battery pins. Then, tighten the pin as much as possible.
6. Connect the other battery cable wire exactly as explained in number 5. It does not matter which pin connects to the plus or minus terminal of the battery cable or battery itself.
7. Connect a heavy-duty 9 volt battery. Let it hang loose or tape it to the back of your machine.

Whenever your supply tray is empty the bulb in the upper left hand corner will light up. Also, whenever you get a jackpot, the jackpot bulb in the center of your machine will light up. The battery performs no other function.

TROUBLE SHOOTING SUGGESTIONS

If either one of your bulbs does not light do the following:

1. Wiggle the fuse receptacle while the supply tray is empty so that you can see if this makes the bulb light.
2. Check the four actuator pins marked (D) and (E). The raised portion on each pin must touch one another. Bend the pins so that they connect properly.
3. Open the front of your machine and drop a ball into any jackpot win pocket while you are looking at the back of the machine. You'll be able to see how the jackpot light is actuated and what adjustments must be made.
